$$\nabla \cdot \mathbf{E} = \rho \quad (15)$$

Let \mathbf{E} be given by

$$\mathbf{E} = \frac{1}{\epsilon_0} \nabla \phi \quad (16)$$

The first part into the term chosen to be quadratic in the field tensor because we want to derive a linear field equation in which the interpolation theorem holds. The action has to be a scalar, the simplest quadratic scalar of the field tensor is the product given in Eq. (20).

$$\begin{pmatrix} E_1 & -E_2 & 0 \\ E_2 & E_1 & -E_3 \\ 0 & E_3 & 0 \end{pmatrix}$$

The three spatial components of \mathbf{E} , (20)

yield the magnetic induction law

$$\nabla \times \mathbf{B} = \frac{1}{c} \frac{\partial \mathbf{E}}{\partial t} \quad (26)$$

Modular arithmetics (1)

It is about integers.

Let's assume we arithmetics **mod 8**. It means the possible values are 0,1,2,3,4,5,6,7. if we move below or above we need to wrap up.

Modular arithmetics (1)

$$3 + 3 \bmod 8 = 6 \bmod 8$$

$$10 \bmod 8 = 2 \bmod 8$$

$$5 + 5 \bmod 8 = 2 \bmod 8$$

$$5 \cdot 5 \bmod 8 = 25 \bmod 8 = (3 \cdot 8 + 1) \bmod 8 = 1 \bmod 8$$

Now we do **NOT have multiplication inverse** for 4, ie. we cannot divide by 4 in modulo 8, ie. solve this equation We have only multiplication inverse for 1 which is 1; 3 which is 3; 5 which is 5, and 7 which is 7.

$$\begin{aligned}19(2x + 7) - 6 &\equiv 2x + 6 \\19 \cdot 2x + 19 \cdot 7 - 6 &\equiv 2x + 6 \\5x + 1 - 6 &\equiv 2x + 6 \\5x + 1 - 6 + 6 &\equiv 2x + 6 + 6 \\5x + 1 &\equiv 2x + 1 \\x &\equiv 0\end{aligned}$$

Elliptic curves (4)

Visually addition looks like here for elliptic curves with one remark: it is modulo PRIME

Elliptic curves (4)

It is called **Chord-and-tangent rule**
visually $P_1 + P_2 = P_3$

Elliptic curves (4)

$y=\text{INF}$ is identity element, and because of that $P_1^{-1} = P_2$
 $Q_1^{-1} = Q_2$

Elliptic curves (4)

Chord-and-tangent rule algebraically

(Tangent Rule) If $P = (x, y)$ with $y \neq 0$, the group law $P \oplus P = (x', y')$ is defined as follows:

$$x' = \left(\frac{3x^2 + a}{2y} \right)^2 - 2x \quad , \quad y' = \left(\frac{3x^2 + a}{2y} \right) (x - x') - y$$

(Chord Rule) If $P = (x_1, y_1)$ and $Q = (x_2, y_2)$ such that $x_1 \neq x_2$, the group law $R = P \oplus Q$ with $R = (x_3, y_3)$ is defined as follows:

$$x_3 = \left(\frac{y_2 - y_1}{x_2 - x_1} \right)^2 - x_1 - x_2 \quad , \quad y_3 = \left(\frac{y_2 - y_1}{x_2 - x_1} \right) (x_1 - x_3) - y_1$$
