$$\mathcal{L} = \nabla \cdot \mathbf{E} \quad (15)$$

The first term has been chosen to be quadratic in the field tensor because we want to derive a linear field equation in which the superposition theorem holds. The action has to be a scalar, the simplest quadratic scalar is the sum of the two terms of the product given in Eq.

$$S = \frac{1}{2} \int d^3x \frac{1}{\mu_0} \epsilon_{ijk} \partial_i E_j \partial_k E_i \quad (16)$$

The three spatial components of Eq. (26) yield the magnetic induction law

$$\nabla \times \mathbf{B} = \frac{1}{\mu_0} \partial_i \mathbf{E} + \frac{4\pi}{\mu_0} \mathbf{j} \quad (28)$$

Modular arithmetics (1)

It is about integers.

Modular arithmetics (1)

It is about integers.

Let's assume we arithmetics **mod 8**. It means the possible values are $0, 1, 2, 3, 4, 5, 6, 7$. if we move below or above we need to wrap up.

Modular arithmetics (1)

$$3 + 3 \bmod 8 = 6 \bmod 8$$

$$10 \bmod 8 = 2 \bmod 8$$

$$5 + 5 \bmod 8 = 2 \bmod 8$$

$$5 \cdot 5 \bmod 8 = 25 \bmod 8 = (3 \cdot 8 + 1) \bmod 8 = 1 \bmod 8$$

Modular arithmetics (1)

$$3 + 3 \bmod 8 = 6 \bmod 8$$

$$10 \bmod 8 = 2 \bmod 8$$

$$5 + 5 \bmod 8 = 2 \bmod 8$$

$$5 \cdot 5 \bmod 8 = 25 \bmod 8 = (3 \cdot 8 + 1) \bmod 8 = 1 \bmod 8$$

Let's solve in mod 11:

$$\begin{aligned}19(2x + 7) - 6 &\equiv 2x + 6 \\19^*2x + 19^*7 - 6 &\equiv 2x + 6 \\5x + 1 - 6 &\equiv 2x + 6 \\5x + 1 - 6 + 6 &\equiv 2x + 6 + 6 \\5x + 1 &\equiv 2x + 1 \\x &\equiv 0\end{aligned}$$

We have solution: $\{.., -22, -11, 0, 11, 22, \dots\}$ As in each row of mult table there is 1 we have inverse for each congruence group!

Elliptic curves (4)

Visually addition looks like here for elliptic curves with one remark: it is modulo PRIME

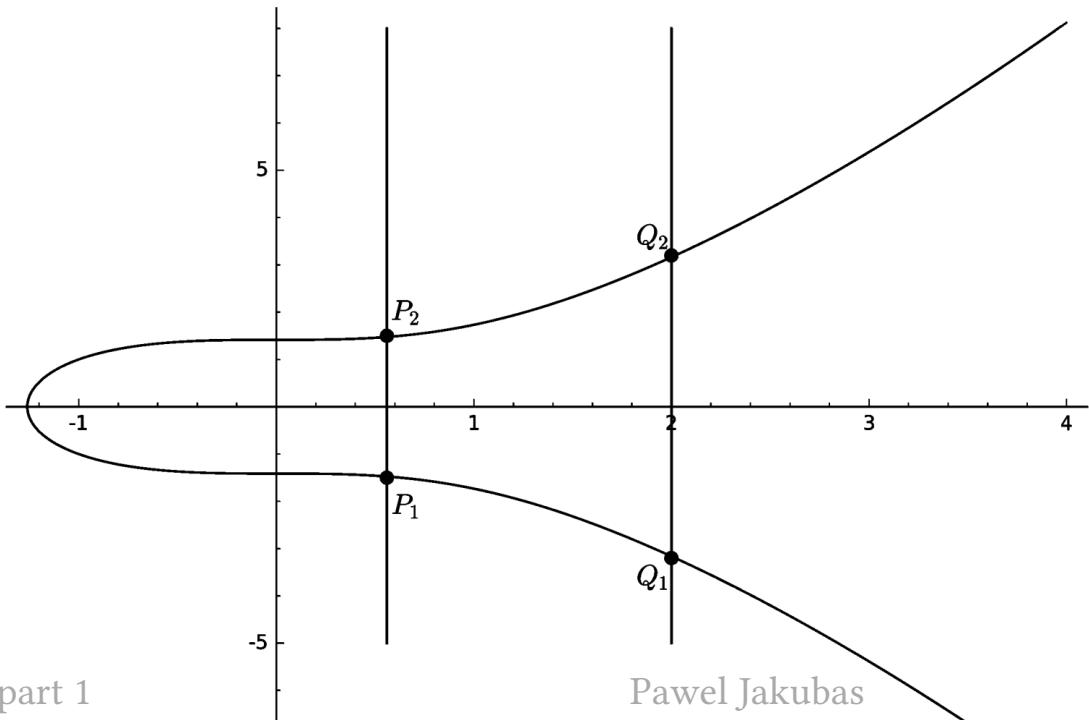

Elliptic curves (4)

It is called **chord-and-tangent** rule and visually looks like below $P_1 + P_2 = P_3$

Elliptic curves (4)

$y=INF$ is identity element, and because of that $P_1^{-1} = P_2$
 $Q_1^{-1} = Q_2$

Elliptic curves (4)

chord-and-tangent rule algebraically is following

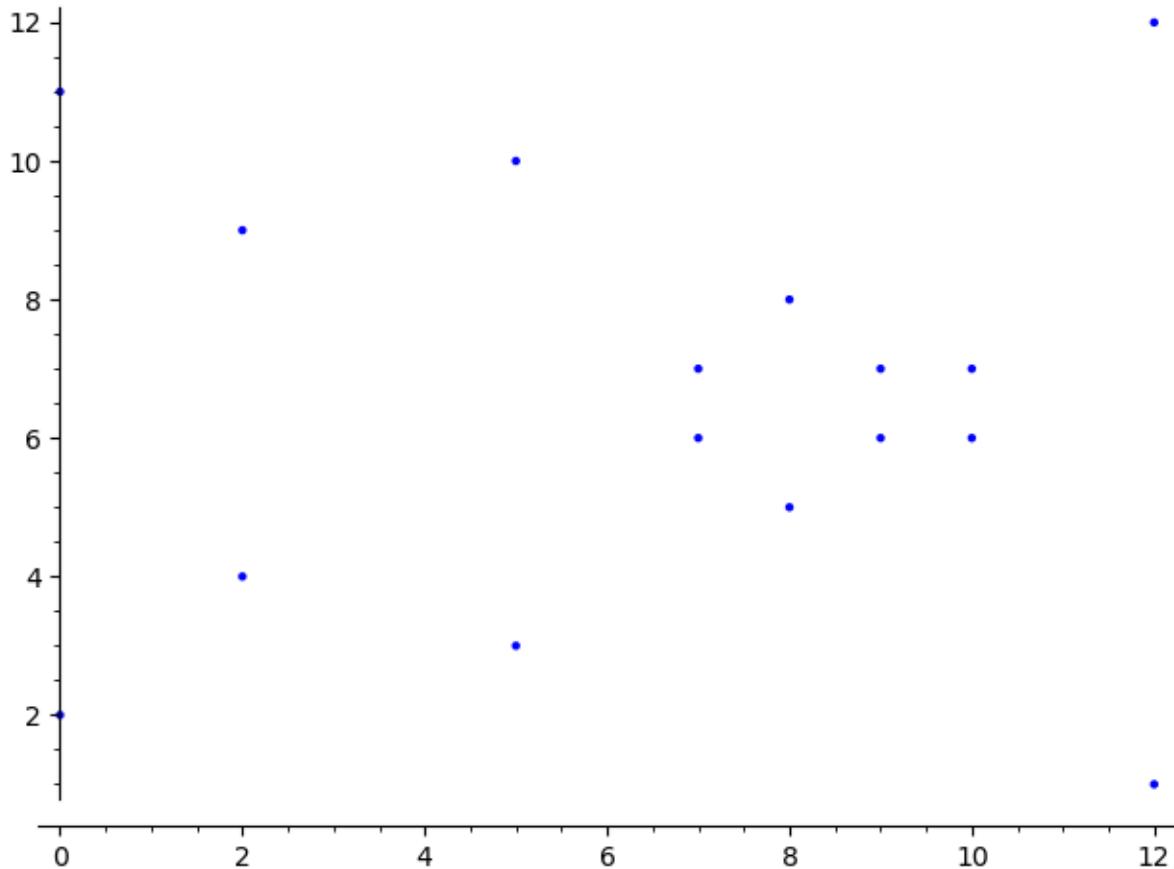

(Tangent Rule) If $P = (x, y)$ with $y \neq 0$, the group law $P \oplus P = (x', y')$ is defined as follows:

$$x' = \left(\frac{3x^2 + a}{2y} \right)^2 - 2x \quad , \quad y' = \left(\frac{3x^2 + a}{2y} \right) (x - x') - y$$

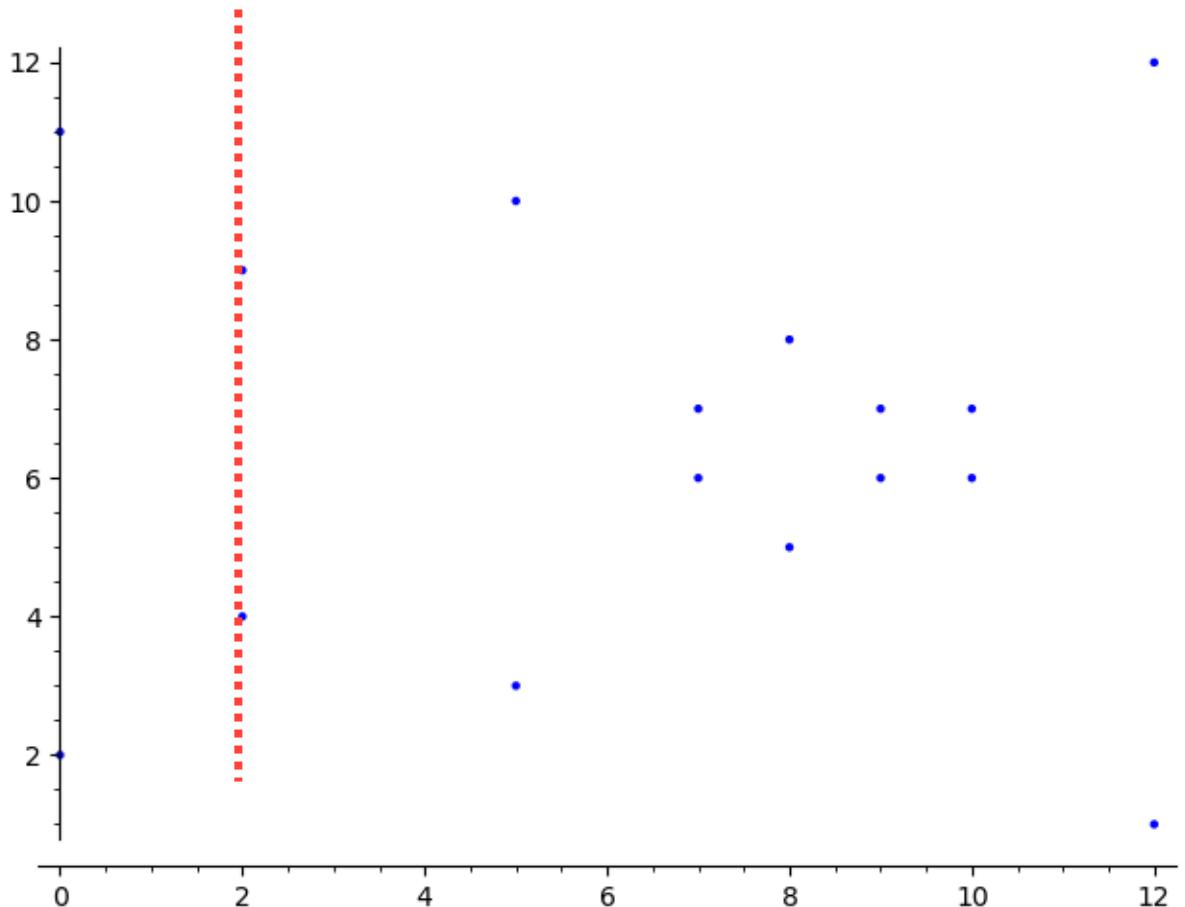

(Chord Rule) If $P = (x_1, y_1)$ and $Q = (x_2, y_2)$ such that $x_1 \neq x_2$, the group law $R = P \oplus Q$ with $R = (x_3, y_3)$ is defined as follows:

$$x_3 = \left(\frac{y_2 - y_1}{x_2 - x_1} \right)^2 - x_1 - x_2 \quad , \quad y_3 = \left(\frac{y_2 - y_1}{x_2 - x_1} \right) (x_1 - x_3) - y_1$$

At this moment we can solve problems that are linear, meaning can be expressed as set of linear expressions:

$$a_{11} * x_1 + a_{12} * x_2 + \dots = b_1$$

$$a_{21} * x_1 + a_{22} * x_2 + \dots = b_2$$

...

$$a_{n1} * x_1 + a_{n2} * x_2 + \dots = b_n$$

but we cannot solve:

$$\mathbf{xy = 9}$$

=> pairings

Pairings of elliptic curves (1)

We are going to use TWO groups together

$$(G_1, G_2) = G_T$$

G_1 elliptic curve point => 2 numbers

G_2 elliptic curve point over an extended field in the form of polynomials $\mathbf{aw} + \mathbf{b}$ and $\mathbf{a}'\mathbf{w} + \mathbf{b}'$ => 4 numbers

For $A \in G_1$, $B \in G_2$ and $C \in G_T$

G_T is multiplicative

$$e(A, B) = C \Rightarrow e(A^x, B^y) = C^{xy}$$

Pairings of elliptic curves (2)

G_1 has generator A

G_2 has generator B

C is pairing $e(G_1, G_2) = g$

$xy = 12$

$x = 4$ and $y = 3$

$e(4A, 3B) = C^{12}$

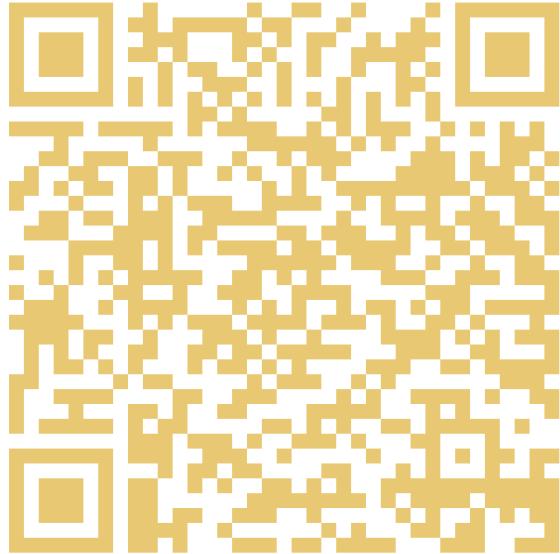

G_1 and G_2 are elliptic groups

G_T is multiplicative group of an extensive field

$G_1 = G_2$ symmetric

$G_1 \neq G_2$ antisymmetric (used in production due to performance)

That's it! More to come in the future
